Convolutional Neural Networks

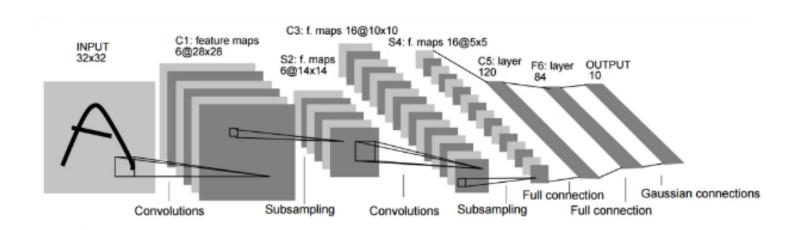

B/W Image 2x2px Pixel 1 Pixel 2 Pixel 1 Pixel 2 2d array $0 \le \text{pixel value} \le 255$ $0 \le \text{pixel value} \le 255$ Pixel 3 Pixel 4 Pixel 3 Pixel 4 $0 \le \text{pixel value} \le 255$ $0 \le \text{pixel value} \le 255$ Colored Image 2x2px Pixel 2 Pixel 1 Pixel 1 Pixel 2 3d array $0 \le \text{pixel value} \le 255$ $0 \le \text{pixel value} \le 255$ Pixel 3 Pixel 4 Pixel 4 Pixel 3 \leq pixel value \leq 255 $0 \leq$ pixel value \leq 255

CNN Steps

- Convolution (with ReLU)
- Max Pooling
- Flattening
- Full Connection

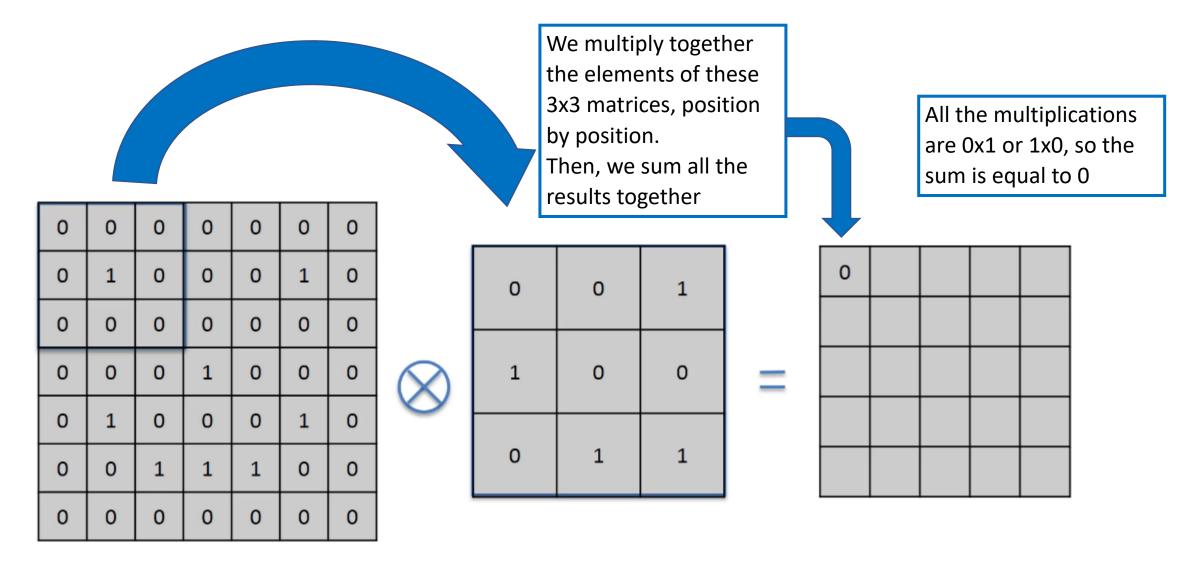

Step 1 - Convolution

This is the transformation in mathematical terms

$$(f*g)(t) \stackrel{\mathrm{def}}{=} \int_{-\infty}^{\infty} f(au) \, g(t- au) \, d au$$

• The verb to use is "to convolve"

That translated from Math is 'to combine'

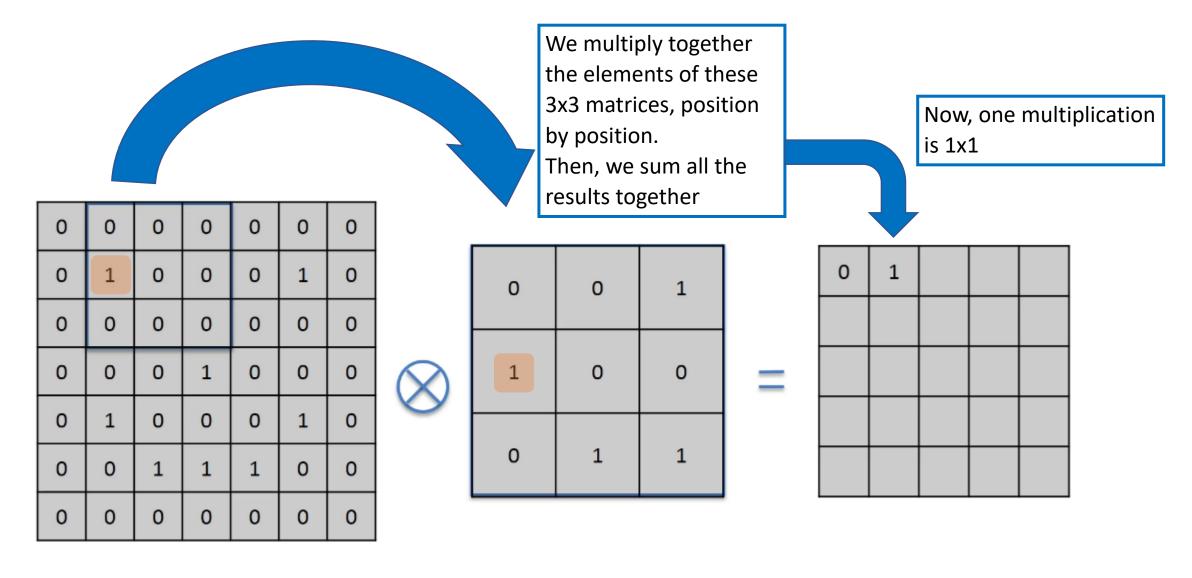

Input Image

Simplified as just 1s and 0s per pixel

Feature Detector

AKA Filter
Usually, 3x3 but it could be larger
It can contain negative values too

Feature Map

Input Image

Simplified as just 1s and 0s per pixel

Feature Detector

AKA Filter
Usually, 3x3 but it could be larger
It can contain negative values too

Feature Map

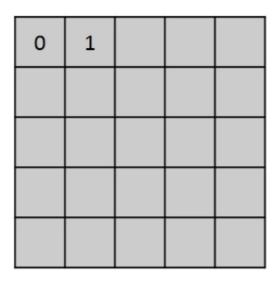

The movement of this matrix is called **stride**

 Here we have a stride of 1 pixel

| 0 | 0 | 0 | 0 | 0 | 0 | 0 |
|---|---|---|---|---|---|---|
| 0 | 1 | 0 | 0 | 0 | 1 | 0 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| 0 | 1 | 0 | 0 | 0 | 1 | 0 |
| 0 | 0 | 1 | 1 | 1 | 0 | 0 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| 0 | 0 | 1 |
|---|---|---|
| 1 | 0 | 0 |
| 0 | 1 | 1 |

<u>Input Image</u>

Simplified as just 1s and 0s per pixel

Feature Detector

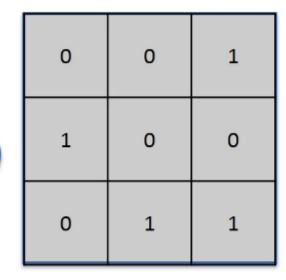

AKA Filter
Usually, 3x3 but it could be larger
It can contain negative values too

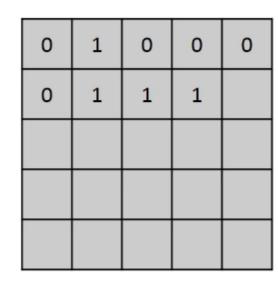

Feature Map

After 10 strides

 Best values for the stride is by 1 or 2 pixels

| 0 | 0 | 0 | 0 | 0 | 0 | 0 |
|---|---|---|---|---|---|---|
| 0 | 1 | 0 | 0 | 0 | 1 | 0 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| 0 | 1 | 0 | 0 | 0 | 1 | 0 |
| 0 | 0 | 1 | 1 | 1 | 0 | 0 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 |

<u>Input Image</u>

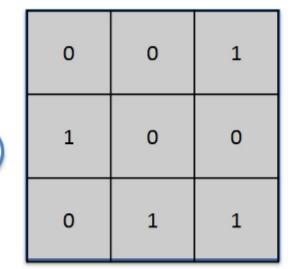

Simplified as just 1s and 0s per pixel

Feature Detector

AKA Filter
Usually, 3x3 but it could be larger
It can contain negative values too

Feature Map

| 0 | 0 | 0 | 0 | 0 | 0 | 0 |
|---|---|---|---|---|---|---|
| 0 | 1 | 0 | 0 | 0 | 1 | 0 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| 0 | 1 | 0 | 0 | 0 | 1 | 0 |
| 0 | 0 | 1 | 1 | 1 | 0 | 0 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| 0 | 1 | 0 | 0 | 0 |
|---|---|---|---|---|
| 0 | 1 | 1 | 1 | 0 |
| 1 | 0 | 1 | 2 | 1 |
| 1 | 4 | 2 | 1 | 0 |
| 0 | 0 | 1 | 2 | 1 |

<u>Input Image</u>

Simplified as just 1s and 0s per pixel

Feature Detector

AKA Filter
Usually, 3x3 but it could be larger
It can contain negative values too

Feature Map

Step 1 - Convolution

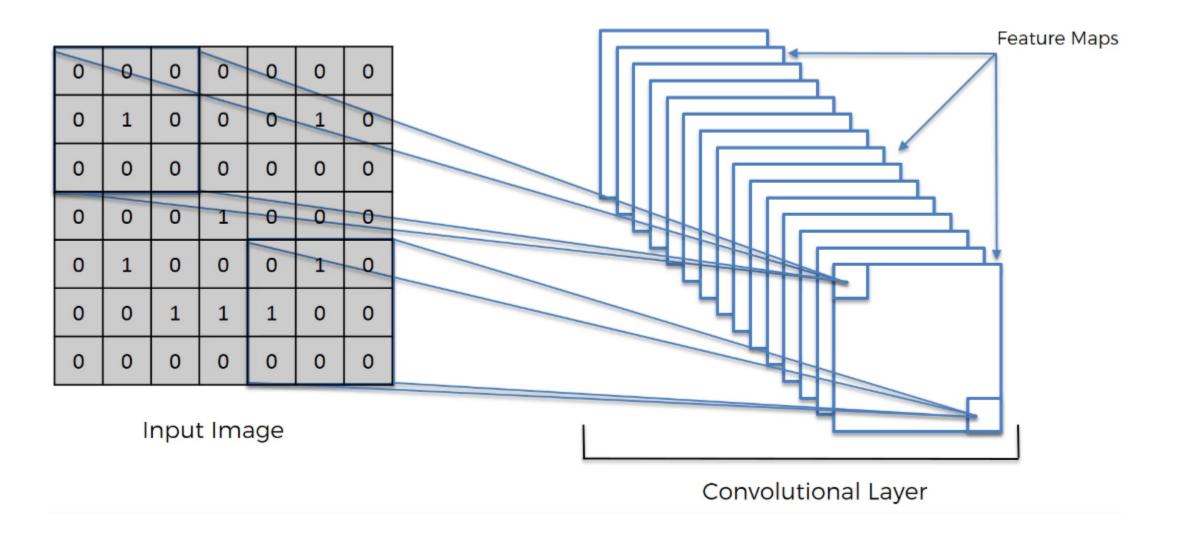

• What is the **Feature Map**? What did we obtain?

- 1. We reduced the size of the original matrix The more, the larger is the **stride**
- 2. The higher are the numbers, the more precisely the detected feature appears in the original image

| 0 | 1 | 0 | 0 | 0 |
|---|---|---|---|---|
| 0 | 1 | 1 | 1 | 0 |
| 1 | 0 | 1 | 2 | 1 |
| 1 | 4 | 2 | 1 | 0 |
| 0 | 0 | 1 | 2 | 1 |

Note that it still preserves the spatial relationships between pixels

We don't lose the pattern

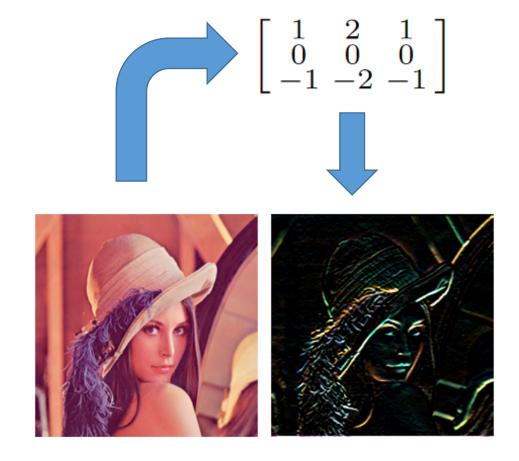

• The network will be trained to recognize a series of Features that are then stored in a collection of Feature Maps

This is the **Convolutional Layer**

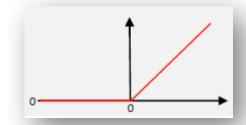

Step 1 - Convolution

Another example of Feature Detector (Horizontal edge)

Step 1 - Convolution

- After creating the set of Feature Maps, we need to add some nonlinearity
- We apply the Rectifier activation function (ReLU)

- ➤ All the negative values become positive values
- This helps reducing the graduality of the color palette.
 - Example: In a picture, colors go from bright to dark gradually.
 - If we remove the negatives, it will change more abruptly. Less linearly!

 We need to ensure that our neural network has a property called spatial invariance

Basically, that it doesn't care where the features are and doesn't care if the features are a bit tilted, different, relatively closer or farer apart, and so on.

| 0 | 1 | 0 | 0 | 0 | |
|---|---|---|---|---|--|
| 0 | 1 | 1 | 1 | 0 | |
| 1 | 0 | 1 | 2 | 1 | |
| 1 | 4 | 2 | 1 | 0 | |
| 0 | 0 | 1 | 2 | 1 | |

Max Pooling

| 1 | 1 | 0 |
|---|---|---|
| | | |
| | | |

Feature Map

- We pick the maximum value in a 2x2 sub-square (the size can vary)
- Stride is 2 here, but it can vary
- If at the end of the row, we just continue

Pooled Feature Map

 Each position contains the maximum value found in the sub-squares

| 0 | 1 | 0 | 0 | 0 | |
|---|---|---|---|---|--|
| 0 | 1 | 1 | 1 | 0 | |
| 1 | 0 | 1 | 2 | 1 | |
| 1 | 4 | 2 | 1 | 0 | |
| 0 | 0 | 1 | 2 | 1 | |
| | | | | | |

Feature Map

- We pick the maximum value in a 2x2 sub-square (the size can vary)
- Stride is 2 here, but it can vary
- If at the end of the row, we just continue

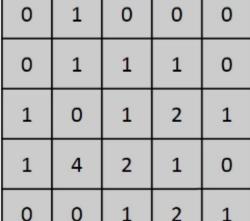

Max Pooling

| 1 | 1 | 0 |
|---|---|---|
| 4 | 2 | 1 |
| 0 | 2 | 1 |

<u>Pooled Feature Map</u>

 Each position contains the maximum value found in the sub-squares

Feature Map

Max Pooling

| 1 | 1 | 0 |
|---|---|---|
| 4 | 2 | 1 |
| 0 | 2 | 1 |

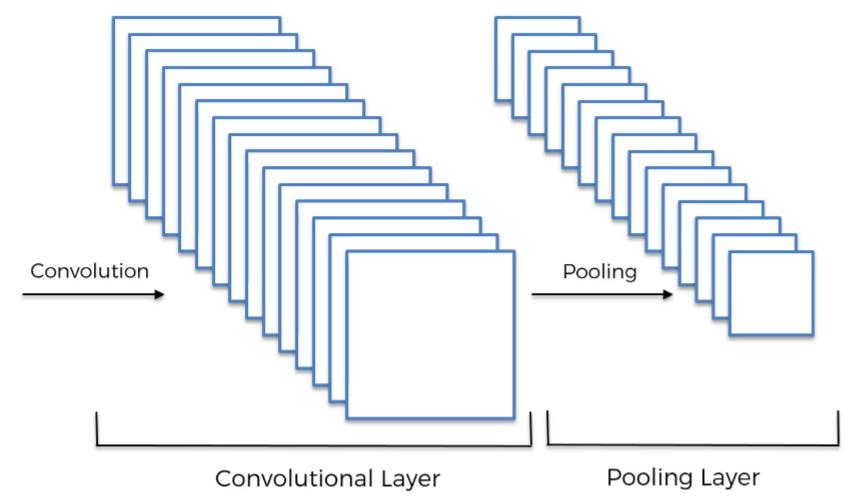

- In the **Pooled Feature Map** we pick the maximum value in a small area (the sub-square)

 If in the Feature Map, the maximum value is moved in a different position, it will still be recognized and passed to the Pooled Feature Map
- We are also reducing the size of the Map, helping the work of the final layer
- Also, it reduces overfitting, because we are not training on the actual training data anymore

Convolution + Pooling

| 0 | 0 | 0 | 0 | 0 | 0 | 0 |
|---|---|---|---|---|---|---|
| 0 | 1 | 0 | 0 | 0 | 1 | 0 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| 0 | 1 | 0 | 0 | 0 | 1 | 0 |
| 0 | 0 | 1 | 1 | 1 | 0 | 0 |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 |

Input Image

Step 3 - Flattening

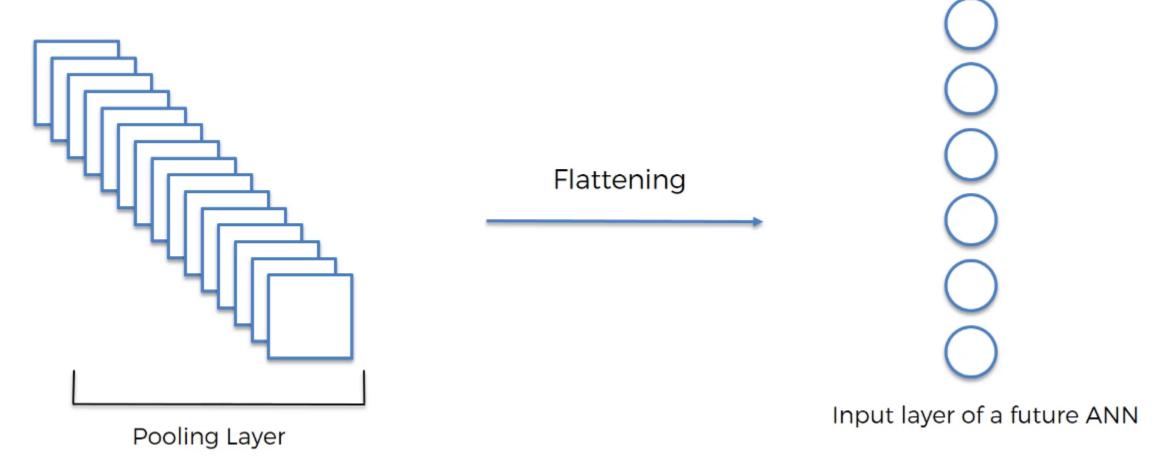

| 1 | 1 | 0 | |
|---|---|---|--|
| 4 | 2 | 1 | |
| 0 | 2 | 1 | |

Flattening

Pooled Feature Map

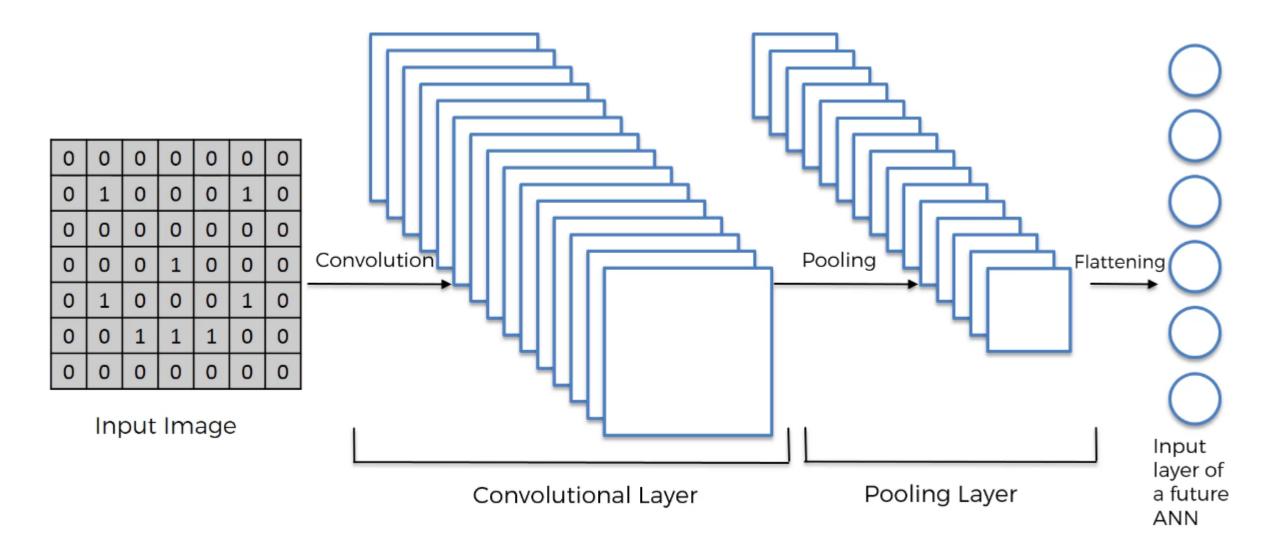

• Simply, we convert the matrices in a vector (by rows)

Step 3 - Flattening

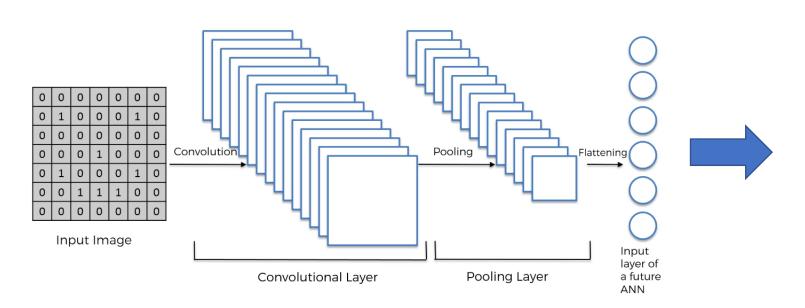

• Simply, we convert the matrices in a vector (by rows)

Convolution + Pooling + Flattening

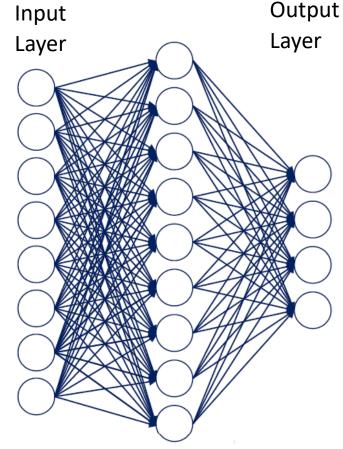

Step 4 – Full Connection

We finally attach the ANN

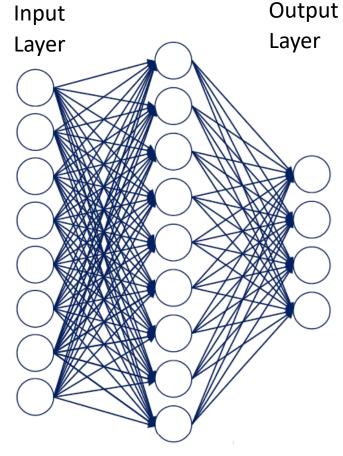

Note that in CNNs, the hidden layers are called "Fully Connected Layers"

Fully Connected Layer/s

Step 4 – Full Connection

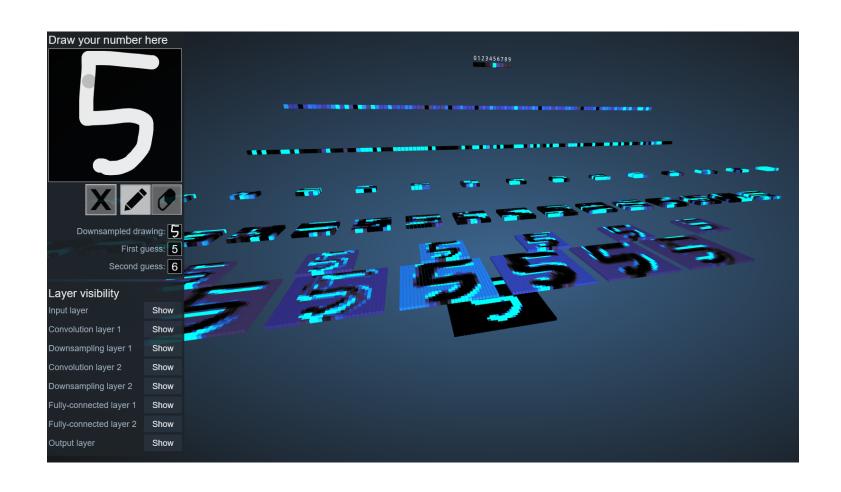

- ➤ In this network, though, the backpropagation will not simply identify the weights to update, but also the "features"
- In fact, the Feature Detectors are also modified based on the error (via gradient descent)

Fully Connected Layer/s

• Check this out:

https://www.cs.ryerson.ca/~aharley/vis/conv/

CNNs in TensorFlow

• https://www.tensorflow.org/tutorials/images/cnn

```
model = models.Sequential()
model.add(layers.Conv2D(32, (3, 3), activation='relu', input_shape=(32, 32, 3)))
model.add(layers.MaxPooling2D((2, 2)))
model.add(layers.Conv2D(64, (3, 3), activation='relu'))
model.add(layers.MaxPooling2D((2, 2)))
model.add(layers.Conv2D(64, (3, 3), activation='relu'))
```

Dropout

 To reduce overfitting, we can apply **Dropout** to the network Basically, a form of regularization

 The idea is that we let a layer to randomly drop out a few output units from the layer itself during the training process

By setting the activation to zero

We can pick the percentage of the output units that are dropped out randomly from the applied layer. Example:

```
layers.MaxPooling2D(),
layers.Dropout(0.2),
layers.Flatten(),
```
